

Contact Lens Basics

Nathalie Findlater OD

1

Objectives

- History of Contact Lens development and technology
- What we treat with contact lenses
- Types of contact lenses
 - Soft
 - Rigid
 - Hybrid
- Parameters of contact lenses

2

History of Contact Lenses

- 1508 the concept of contact lens was sketched by Leonardo De Vinci
- 1823 practical designs were created by Sir John Hershel
- 1887 first CL made from glass and fitted over the entire eye
- 1939 first plastic CL
- 1948 first plastic CL that covers only the cornea
- 1971 soft contact lens
- 1978 RGP
- 1981 overnight wear FDA approved
- 1996 daily disposable introduced
- 2002 Silicone hydrogel first marketed
- 2002 OrthK approved by FDA

3

What we treat

4

Refractive Error

- Myopia (nearsightedness)
- Hyperopia (farsightedness)
- Astigmatism
- Presbyopia (changes in accommodation)

• When writing a prescription the **brand type , power , base curve and diameter is needed**

5

Corneal Traumas and Diseases

- Severe corneal abrasions
- Sterile corneal ulcers
- Keratoconus
- Corneal ectasia

6

Ocular Surface Disease

- Scleral Lenses are being prescribed for the management of ocular surface disease.
- Protects the ocular surface and provides continuous hydration
- Cover the entire cornea and provides a fluid reservoir between the back of the lens and the front surface of the cornea
- Sjögren's syndrome - chronic autoimmune disease presenting with dry eyes and mouth
- Exposure keratopathy - results from eyelid malposition
- Neurotrophic keratopathy - impaired corneal innervation and decreased corneal sensitivity.

7

Color Vision Deficiency

- Inherited condition with no cure
- Most commonly trouble seeing red and green or blue and yellow
- Glasses that block certain wavelengths of light and increase the ability to detect red and green
- New research on dyes to be added to contact lens and block the wavelengths that lies between red and green

8

Orthokeratology

- Temporarily reshapes the cornea to improve vision
- Worn at night to reshape the cornea while you sleep
- Mainly used to correct and control myopia
- Rigid gas permeable lenses

9

Soft Contact Lenses

- Made of polymers that absorb water
- Need to be kept in solution to keep from drying out
- Flexible and comfortable to wear
- Handling can be tricky
- Spherical correction
- Toric for astigmatism
- Mono vision or Multi-focal fit
- Color/ tinted

10

Rigid Contact Lenses

Hard lenses

- Older material PMMA did not allow oxygen to flow through to the cornea.
 - Lack of oxygen caused retainment of water and swelling
- RGP's
 - Now made of polymers and plastics that are oxygen permeable
 - Last longer and provide sharper vision
- Scleral
 - Cover the entire corneal surface and rest on the sclera
- Care and Handling
 - Adaptation period
 - Tinted
 - Long life

11

Hybrid Contact Lenses

- Best of both worlds- best visual acuity of RGP and comfort of soft lens
- Center RGP with soft skirt
- Great for corneal astigmatism
- Great for trouble with soft toric lens movement
- Multifocal

12

Wear Schedule

- Daily Disposable- wear when awake and remove before bed
- Bi-weekly
- Monthly
- Quarterly
- Annual
- Extended Wear - continuous or overnight wear
 - 6 days to 30 days
 - Could increase risk of complication , need regular monitoring

13

Care and Handling

- Medical devices
- Washing hands before handling
- Cleaning , rinsing and disinfecting
- Cleaner Removes debris from lens surface
- Rinse removes the cleaner and loosened debris from the surface
- Storage case filled with disinfecting and conditioning solution
- Enzymatic cleaners may be added to reduce build of protein on the surface of the lens

14

Parameters of contact lenses

15

Lens Design and Power

- Prescription of contact lens is different than spectacle because it fits on the eye and not information of the eyes
- This takes account the vertex distance
- RGP are custom made
- Soft contacts are fit by parameters that are provided by the manufacturer

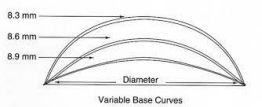

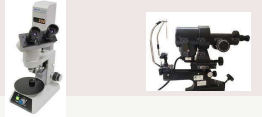

Radius	Material	Power	Material	Power	Material
10.0	PMMA	-10.00	PMMA	-10.00	PMMA
9.5	PMMA	-10.53	PMMA	-10.53	PMMA
9.0	PMMA	-11.11	PMMA	-11.11	PMMA
8.5	PMMA	-11.76	PMMA	-11.76	PMMA
8.0	PMMA	-12.50	PMMA	-12.50	PMMA
7.5	PMMA	-13.33	PMMA	-13.33	PMMA
7.0	PMMA	-14.29	PMMA	-14.29	PMMA
6.5	PMMA	-15.38	PMMA	-15.38	PMMA
6.0	PMMA	-16.67	PMMA	-16.67	PMMA
5.5	PMMA	-18.18	PMMA	-18.18	PMMA
5.0	PMMA	-20.00	PMMA	-20.00	PMMA
4.5	PMMA	-22.22	PMMA	-22.22	PMMA
4.0	PMMA	-25.00	PMMA	-25.00	PMMA
3.5	PMMA	-28.57	PMMA	-28.57	PMMA
3.0	PMMA	-33.33	PMMA	-33.33	PMMA
2.5	PMMA	-40.00	PMMA	-40.00	PMMA
2.0	PMMA	-50.00	PMMA	-50.00	PMMA
1.5	PMMA	-66.67	PMMA	-66.67	PMMA
1.0	PMMA	-100.00	PMMA	-100.00	PMMA

16

Base Curve Radius

- Primary curve on the posterior of the lens
- Approximate the shape of the cornea
- Millimeters of radius of curvature
- Measured by a radiuscope or keratometer

17

Overall Diameter and Optical Zone Diameter

- OAD is the size of the lens from edge to edge at the widest point
- Rigid lens is 8.5mm to 9.5mm
- Soft lens is 11mm to 15mm
- OZD
- Center area that provides optical correction for the patient Vision
- Differed depending on pupil size , the OAD and peripheral curve width

18

Peripheral Curves

- Additional curves on the back surface of the lens that surround the optical zone to help tailor the lens to fit each patient
- Steeper in the center and flatter in the periphery
- Images that gradual slopping of the cornea

19

Edge and Center Thickness

- Center thickness : lens thickness of the center of the lens from posterior to anterior
- The increased thickness of a lens reduces its oxygen permeability
- Hyperopia prescription has a higher center thickness
- Edge thickness is the thickness of the edge of the lens
- Important factor in the comfort of the lens, a thick edge can cause discomfort and irritation
- Higher in myopia prescriptions
